

Reading Note for Slide 1

National Hospital Network project charter | Meds Consulting LLC

Opening

Good morning everyone. We are Meds Consulting LLC, and this first slide introduces our project charter for National Hospital Network, or NHN. The slide summarizes the client background, the business problem, our team structure, the key stakeholders, and the business hypothesis we plan to test.

1. Overview of the business

NHN is a large integrated healthcare system. It operates 42 hospitals and more than 300 outpatient sites across 11 states, and it serves about 2.3 million patients each year. Because the system is this large, a readmission problem affects more than one part of the organization. It can affect patient outcomes, bed capacity, staff workload, and financial performance.

The scale table on the slide is important because it shows why this issue matters at the enterprise level. Even a small percentage increase in readmissions can become a major clinical, operational, and financial challenge when the patient base is this large.

2. Problem Statement

The business problem is that 30-day readmissions continue to rise even though NHN has invested in discharge planning, care coordination, and follow-up services. The readmission rate increased from 14.2 percent in 2022 to 18.4 percent in 2025.

Leadership also estimates more than 42 million dollars in annual readmission-related cost exposure. So the question is not only why patients are coming back, but also where NHN can intervene in a practical and financially responsible way.

Transition cue

After explaining the business problem, move to how our team will divide the work needed to investigate it.

3. Team roles by workstream

Our team is organized by workstream so that each part of the project has a clear owner. Can He leads the project story and presentation. Belal Glab owns data preparation and exploratory analysis. Jingyi Cao focuses on clinical risk analysis. Santosh Kumar Chantati leads predictive modeling. Jeevan-Kumar Mittapalli covers financial impact and ROI. Adarsh Pravinbhai Patel examines care coordination operations. Sam-Aquila Siddani supports dashboard design and recommendations.

Workstream	Owner
Project story and presentation	Can He
Data preparation and exploratory analysis	Belal Glab
Clinical risk analysis	Jingyi Cao
Predictive modeling	Santosh Kumar Chantati
Financial impact and ROI	Jeevan-Kumar Mittapalli
Care coordination operations	Adarsh Pravinbhai Patel
Dashboard and recommendations	Sam-Aquila Siddani

4. Identify Stakeholders

The key stakeholders include executive leadership and finance teams, clinical and operations teams, care coordinators and discharge planners, and patients, caregivers, and community partners. Each group needs a different answer from the project.

For leadership and finance, the focus is the size of the cost exposure and the return from reducing avoidable readmissions. For clinical and operations teams, the focus is which patients are at highest risk and where the workflow breaks down. For care coordinators and discharge planners, the focus is which post-discharge actions are most effective. For patients and caregivers, the goal is a safer transition after discharge and fewer unnecessary returns to the hospital.

5. Business Hypothesis

Our initial hypothesis is that readmissions rise when post-discharge support does not match patient risk. High-risk patients may need faster follow-up, stronger chronic disease support, medication review, transportation help, or coordinated outreach.

We will test which factors have the strongest relationship with readmission and which care coordination steps appear to reduce risk. If the data supports this hypothesis, NHN can focus resources on the patients most likely to benefit from additional support.

Closing

Overall, this project will help NHN connect clinical data, care coordination activity, and financial impact so leadership can identify practical actions to reduce avoidable readmissions.
